

Firewalls

CloudSecure Firewall solution is provided by the Cisco ASA 5500 Series, which is a purpose-built appliance that provides sophisticated security services in a single device including:

- Full Inspection Firewalling
- Virtual Private Networking
- Powerful Intrusion Protection

The Cisco Adaptive Security Algorithm (ASA) 5500 Series Firewall ensures that all users behind it are safe from Internet threats such as viruses, spam and any other malware and intrusions. Its advanced full-environment inspection technology keeps track of the state of authorised users' network requests and prevents unauthorised network access. Its adaptive design not only provides superior protection to online assets, but also extensibility to address future threats.

Your benefits...

Keep corporate resources protected from intrusions:

Cisco firewalls prevent unauthorised access to applications or information by providing you with fine-grain identity or network-based access control. It integrates with popular user authentication services such as Microsoft Active Directory, Lightweight Directory Access Protocol (LDAP), Kerberos, and RSA SecurID.

Deploy new applications safely:

It enables you to safely deploy new applications by providing advanced layer security services for a wide range of popular applications such as Web-based, e-mail, VoIP, and multimedia. It hides corporate network addresses from the Internet for an additional layer of protection against attacks.

Secure remote access to the network:

It provides both SSL and IPSec-based methods of threat-protected Virtual Private Network (VPN) connectivity to remote sites, business partners, and mobile workers.

Business continuity:

Cisco firewalls prevent disruption of mission-critical applications and services due to security breaches by implementing world-class, sophisticated firewall, VPN, and networking technologies.

What we can do for you...

- Installation of new Cisco firewalls
- Firewalls annual maintenance and support
- Monitoring of the firewall and switches
- Disaster Recovery testing
- Hardware and Internet-work Operating System (IOS) upgrades for firewalls and switches
